1The total thickness of the foundation is 950mm
Top layer thickness of cement coating = 25mm, middle layer thickness of reinforced concrete = 720mm,
bottom layer thickness of common concrete = 100mm,gravel=100-200mm

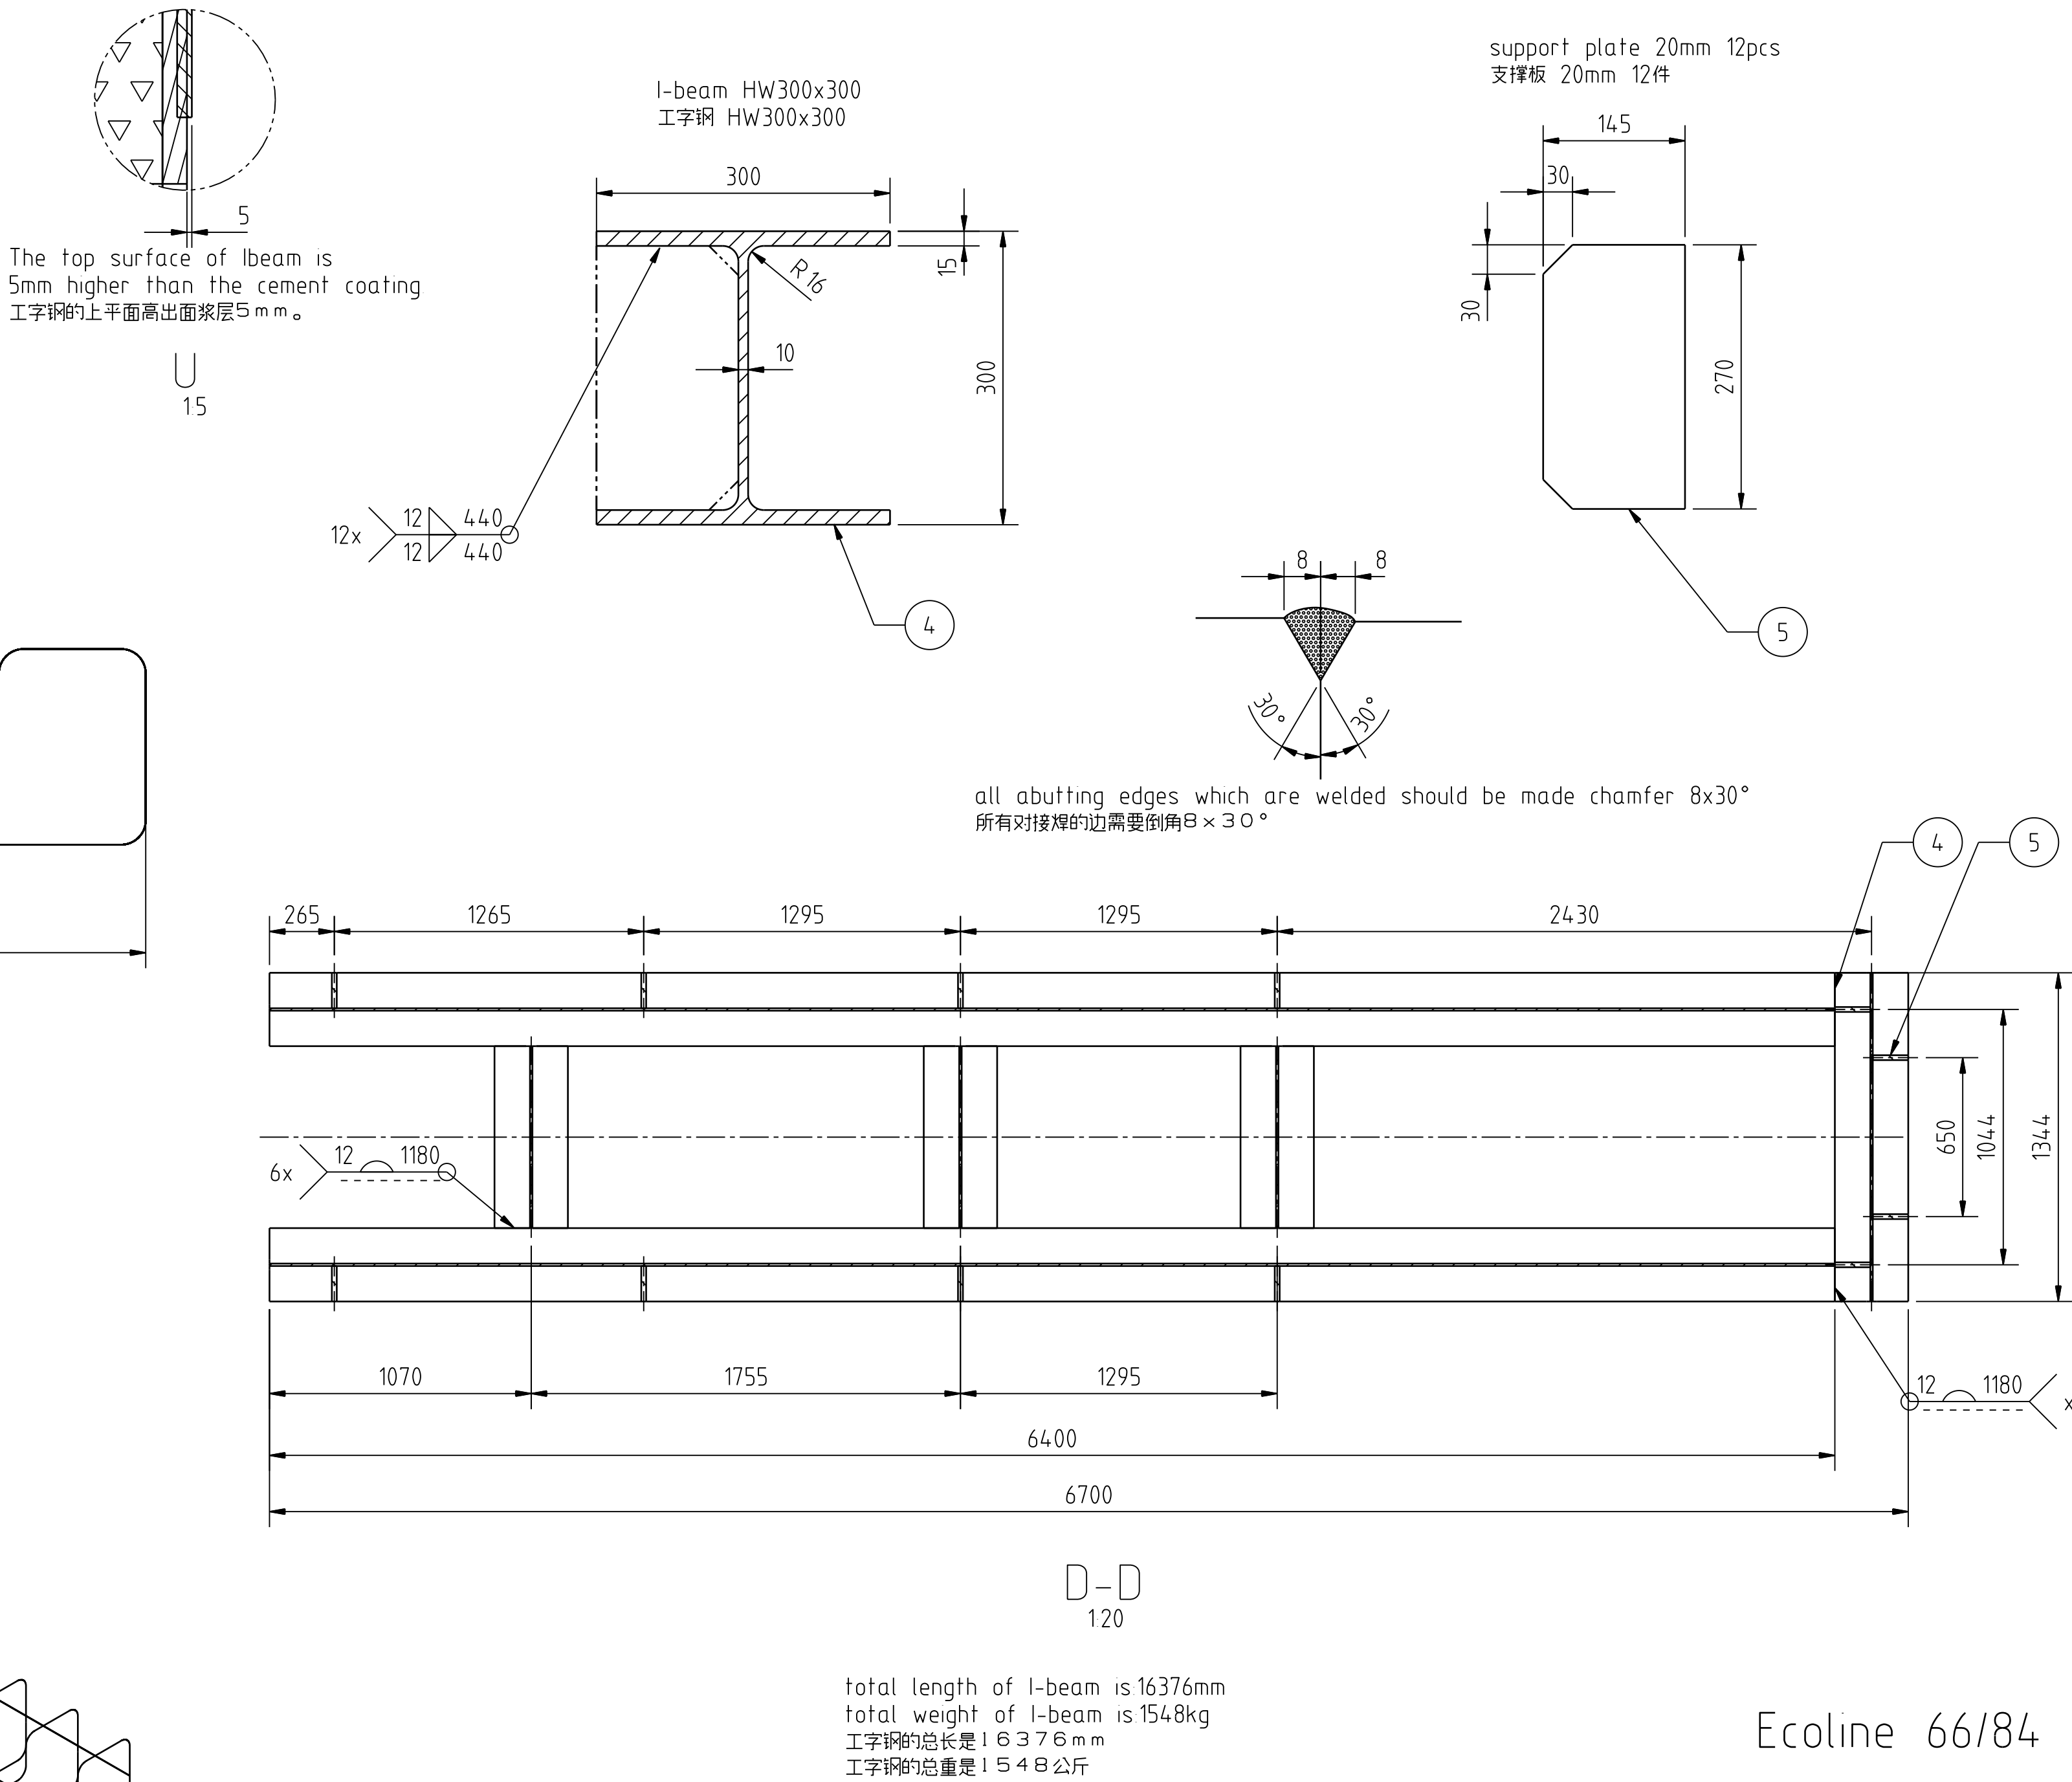

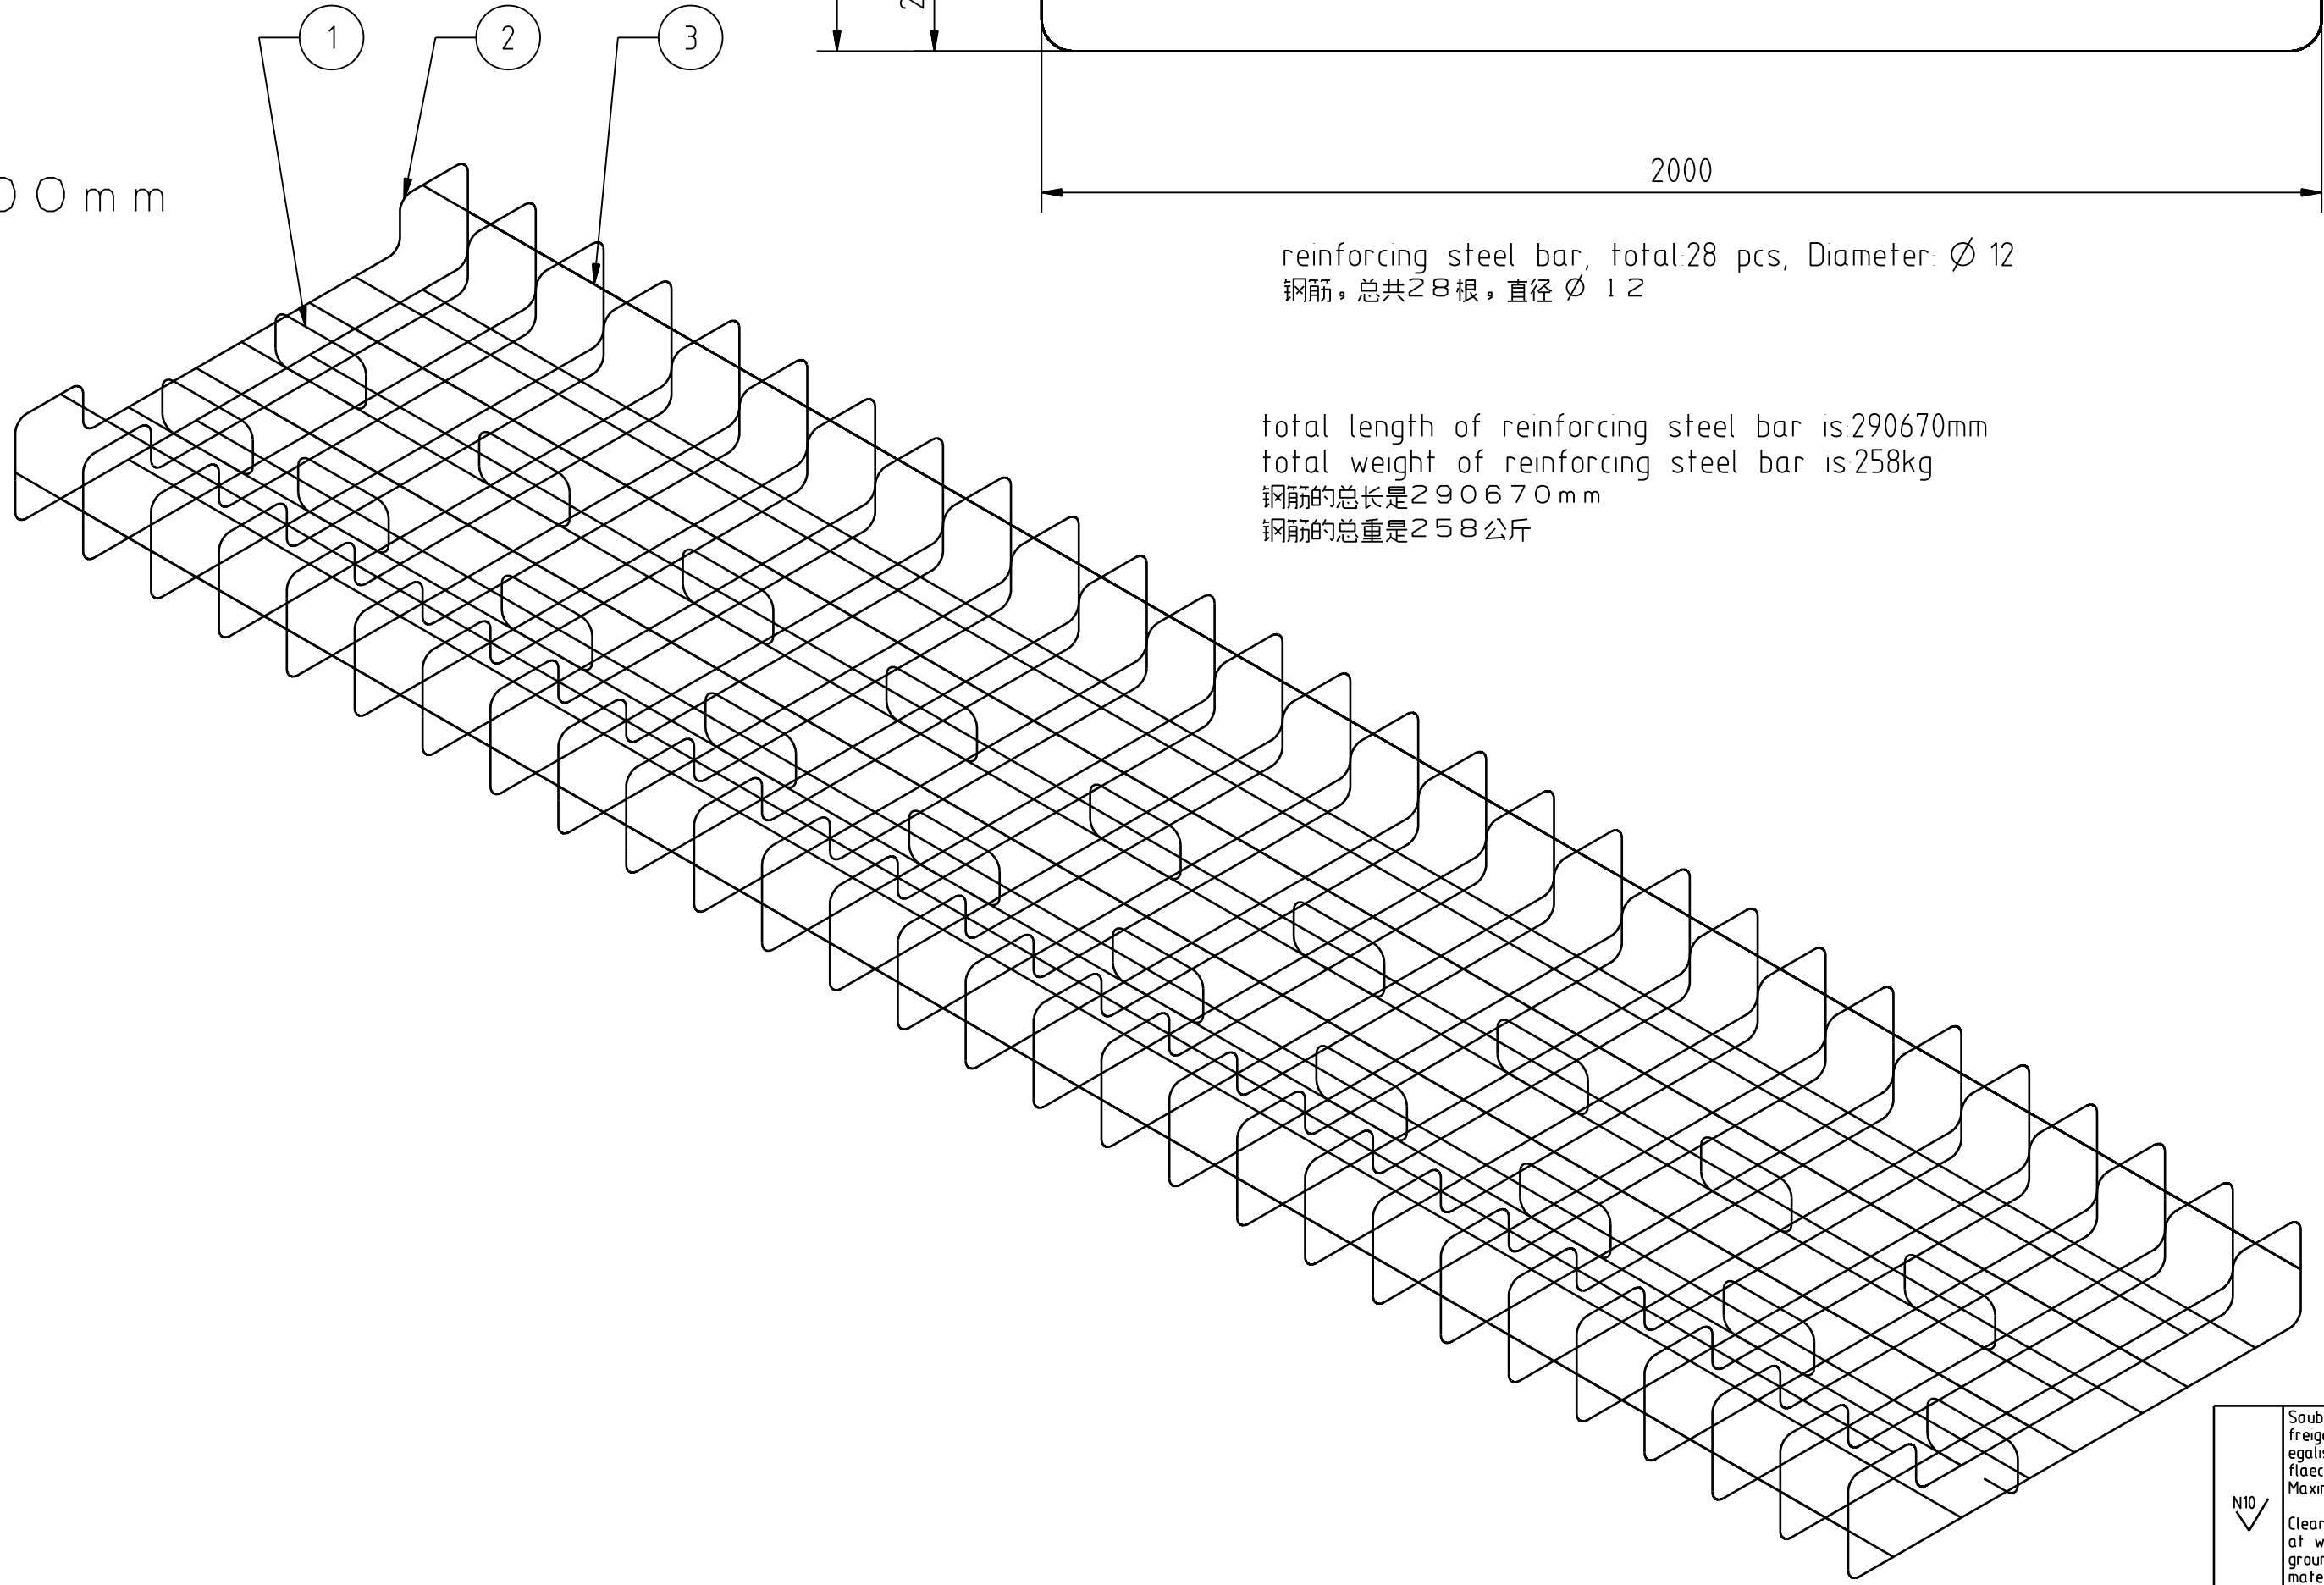

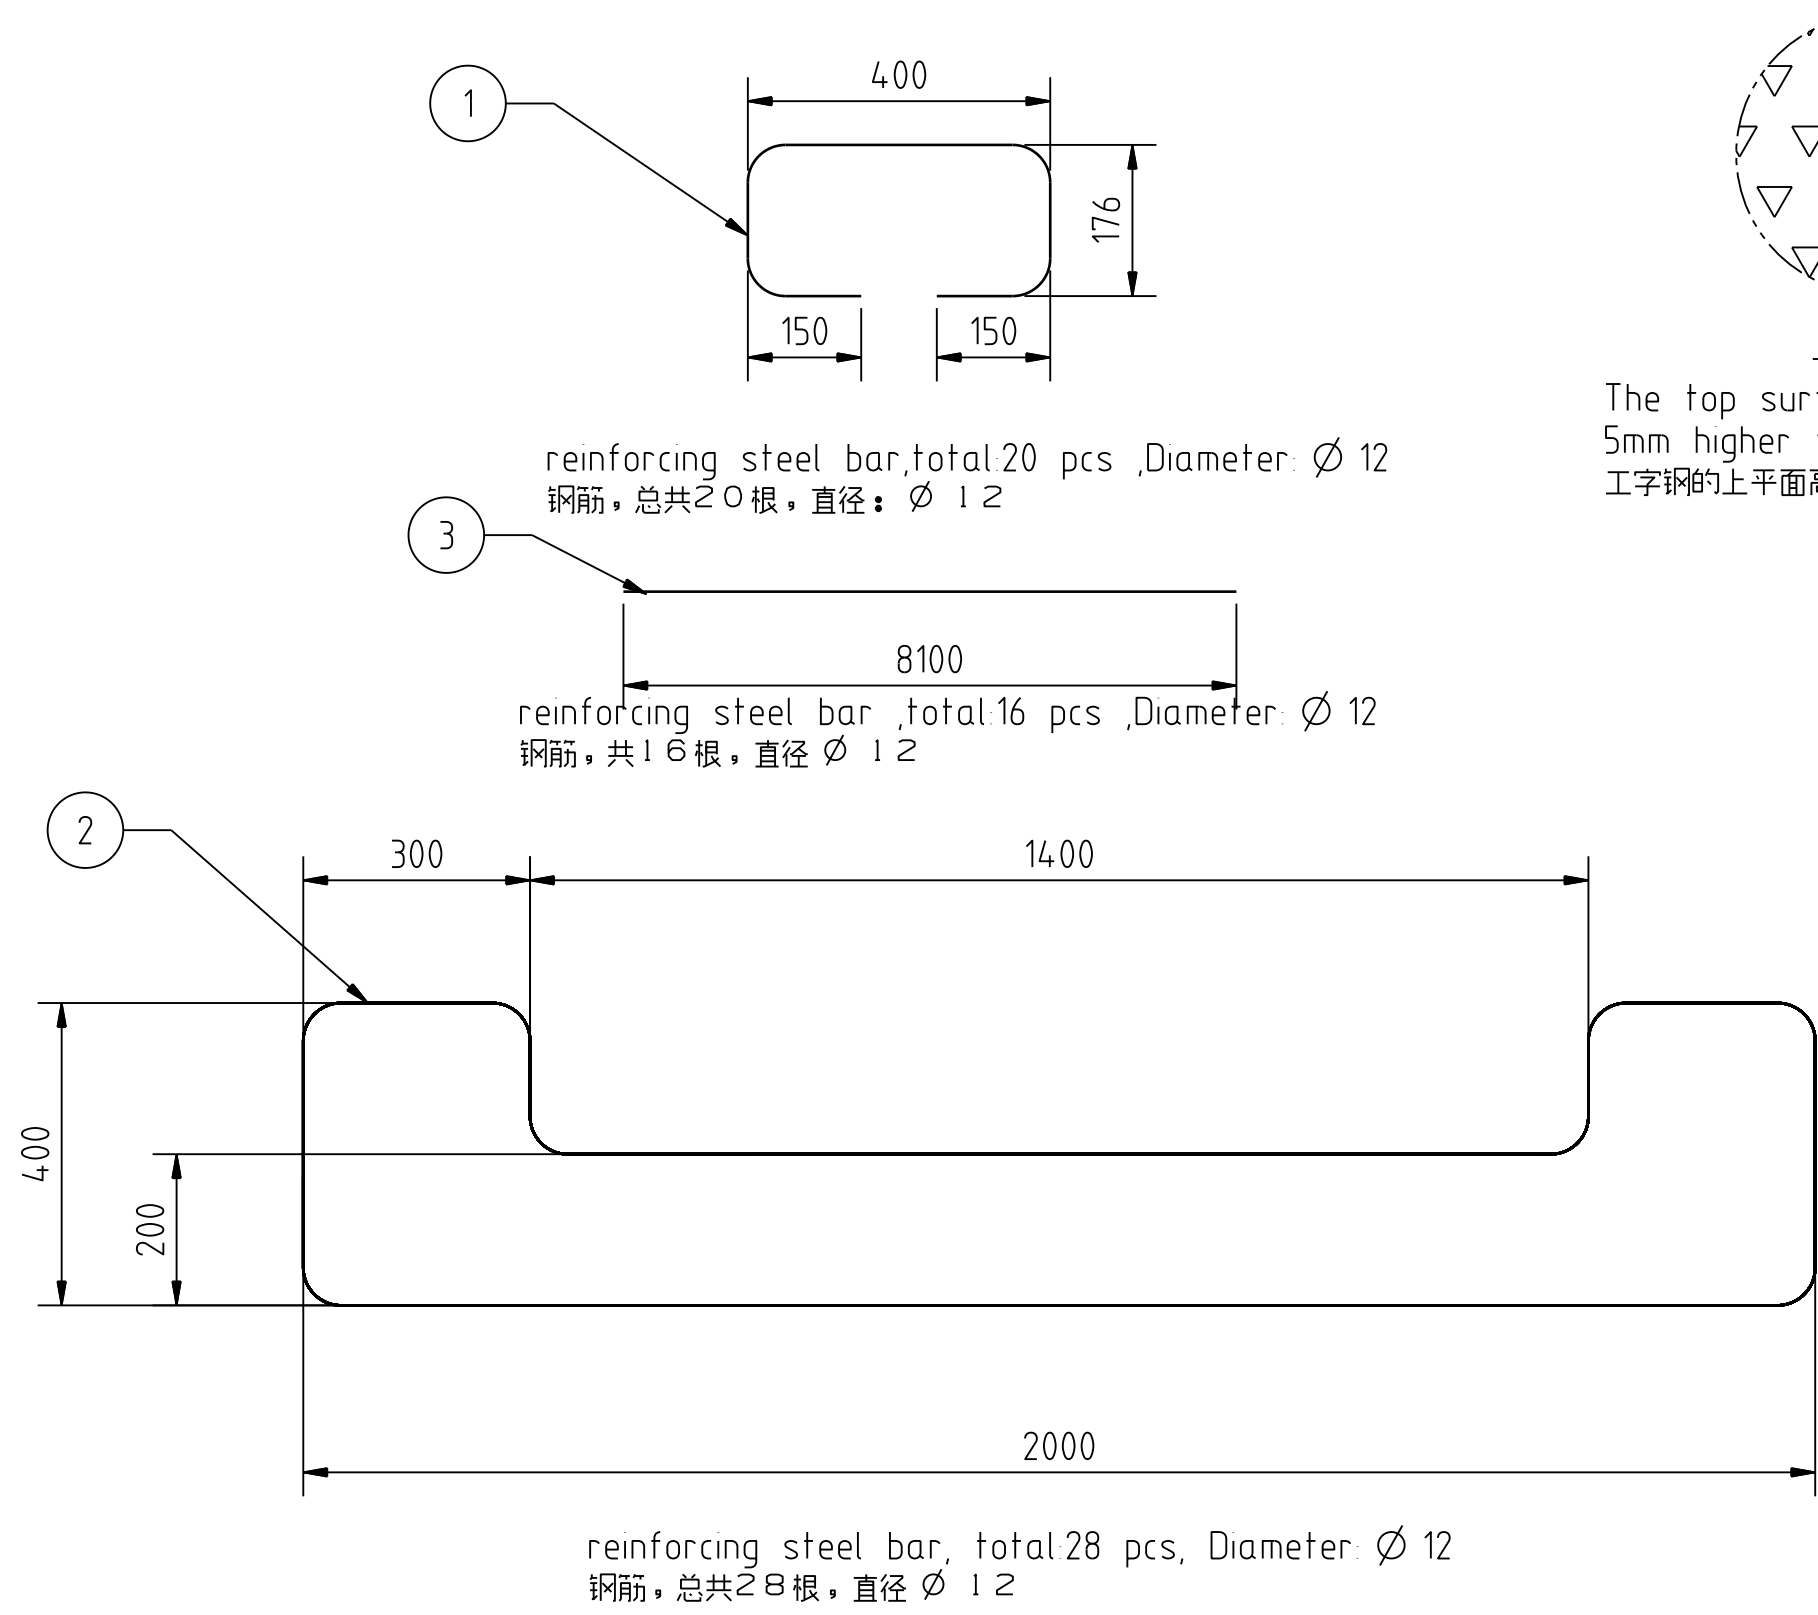

In addition, if the customer excavate on the ground and still find it is loose soil,
must compact the loose soil, for the swampy base, need to pile driving
2Instructions of drawing
Cement coating uses washed river sand, diameter of particles is less than 6mm, use 600kg for per cubic meter
Foundation concrete uses C35 concrete, F_{cm}=33N/mm²
Common concrete uses C16 or C20 concrete
3There are total 3 kinds of reinforcing steel bar, blanking and bending according to the table on the bottom right corner

4The concrete normally needs 28 days to reach strength, but before,
eg after 15 days machine can be mounted but cannot be started up
Only until reach the strength, then machine can be started up

5Unqualified foundation will have bad effect to the DC machine more and more obviously as time goes by,
this kind of effect is not easy to be detected and quantized, and also not easy to be reworked
The solid foundation must be produced according to the drawing

6 After put the whole machine on the foundation according to position as the drawing shown, then weld the plate below of the machine
The plates 6,7,8,9 on I-beam consists in die casting machine

- 地基总厚度是950mm。
顶部的面浆层厚度是25mm，中间的钢筋混凝土层720mm，底部的基础混凝土层100mm，碎石层100-200mm
另外，如果客户地面挖开后发现是松土，
必须夯实松土，对于松软基础，需要打桩。
- 图纸说明
面浆层采用水洗过的河砂，粒径小于6mm，每立方米用600kg。
地基混凝土采用C35号混凝土，耐压33N/mm²以上
基础混凝土层采用C16号或者C20号混凝土。
- 总共使用3种钢筋，下料和折弯请根据图中钢筋的细节图。
- 混凝土通常需要28天达到强度，但是在此之前，例如15天之后，机器可以安装，但是不能启动。
只有等到达到它的强度，那么机器才可以启动。
- 质量不合格的地基对压铸机的影响会随着时间的推移越来越严重。
这种影响不容易被检测和量化，也不容易返修。必须根据图纸生产坚固的地基。
- 整机按图示位置摆放好之后，再将垫板焊好。
工字钢上的垫板6，7，8，9属于压铸机附带。
